Dr. Peter Cotey
Owosso, Michigan**

Patient presented with diabetic peripheral neuropathy, walking required assistance. The patient had no feeling in either leg, from the knees down. A toe had been removed. After five treatments, the patient began experiencing pain (sensation) in the legs (of course any type of feeling is improvement at this stage). The patient completed 12 weeks (24 treatments) and is now walking without a cane and feeling well.

Dear Mr. Klersy:

You would not believe how much better my arm is since being treated with the MICROVASCULAR THERAPY. The Lymphatic drainage on my arm has been eliminated since the treatment! I mean, I'm serious....you are not going to believe it! Since November it was been so swollen and painful! **Now it's back to normal. I very serious!**

I just do not believe you are not marketing that Microvascular Therapy the way you should be. The Lymphedema centers are missing the boat! And your company should be aggressively marketing it to breast cancer patients with Lymphedema patients.

It's unbelievable! All of your brochures target legs and feet. It should target the arm as well. It should target the arms! You have a wonderful product there and I am so glad that I accepted your encouragement for the Microvascular Therapy session.
